

ABSTRACT

The study was conducted in order to estimate the costs and effects of ARVs used in treatment of HIV infected patients, to describe the costs of prophylaxis and treating of opportunistic infections by use of No-ARVs and to determine the incremental cost-effectiveness ratio of No-ART and ART. A cost-effectiveness analysis was conducted from a public health perspective, comparing No-ART with ART intervention. This was a retrospective study done on a cohort of 207 using a pre-ART and ART study design on a five year period observation time (2004 – 2008). The cohort was aged 15 years and above with HIV infection disability and were selected by simple random technique of their records' files.

By the year 2006, with the adult HIV/AIDS prevalence rate of 16% in Zambia, Choma district had a high incidence rate of sexually transmitted infection (STIs) of 15.0 per 1000 population. The HIV infection was at incidence rate of 7.1 per 1000 population and case fatality rate of 195.1 per 1000 admissions and this revealed the high demand of antiretroviral drugs (ARVs) (Choma HMIS, 2006).

The cohort simulation approach used was based on cost-effectiveness Markov Modeling in order to calculate life time costs, life years gained and health effects of ART versus No-ART. The study setting was in a public sector health facility at Choma ART centre. Data was collected using file check list, semi-structured interview schedule and discussion with the key informants who had more than five years experience of managing patients with HIV infections at Choma general hospital. Data analysis was done using Cost Model template (WHO CostIt Model) and Excel spread-sheet.

The study results revealed that the transition probabilities of patients moving from stage 1 – 4 in No-ART was 0.24917 and in ART it was 0.1239. Transition probabilities of moving from 1 to death in No-ART was higher, 0.0678 and in ART it was only 0.0125. In both ART and No-ART cohort, the health status rating patients in stage 1 had a high utility rating of 0.85. In stage 4 the utility rating was 0.28. The lifetime costs of No-ART were \$10,166,199 and for ART, \$12,226,813. The costs per life year gained with No-ART were \$1,166 and ART were \$1,223. The health effects quality-adjusted life years (QALYs) for No-ART were 3,381 and ART, 6.073. The incremental cost-effectiveness ratio was \$765.45. The life years lived with No-ART were 3.25 and with ART were 8.50.

In conclusion, HAART intervention is reasonably cost-effective for HIV-infected patients in Zambia because the intervention reduces the costs of medical care of HIV disease and the incidences of opportunistic infections. This leads to a corresponding reduction in in-patient health care utilization. Results of cost-effectiveness analysis in this study could assist in enhancing efficient resource allocation and equitable access to HIV treatment.

ACKNOWLEDGEMENTS

My work would not have been successfully completed without the support and input of various people during my studies. To all the following people I would like to say thank you very much.

Special thanks and gratitude to my supervisor, Dr. F. Masiye for his dedication, patience and tireless guidance throughout my research dissertation.

Professor K. S. Baboo, my other supervisor, my gratitude to you is immeasurable for your counsel, guidance and support during my studies.

Mr. Chola Lumbwe, who motivated me to undertake the study and gave me a copy of Khayelitsa study done in South Africa. He told me to have courage to venture in the study because it was 'deep water'.

Secondly, my gratitude goes to my employer, the Ministry of Health for allowing me time to pursue my studies, for sponsoring me and also enabling me to take time off to complete my school work.

To all the lecturers in the department of Community Medicine, I say thank you very much.

To Choma General Hospital management team, ART center staff and those who assisted in data collection, many thanks.

To my course mates and colleagues, thank you for encouraging me especially during the time when I almost gave up.

Lastly, to my entire family for being considerate and understanding when I couldn't be with you as I pursued my studies.

DEDICATION

I dedicate this dissertation to my husband Lawrence for his love, understanding, patience and support during my studies. To my late mother Mrs. J. Zulu, who couldn't stay to see me complete my studies. To my children, Musanide, Lishimpa, Joao, Malowa, Tawanda, Nthowa, Changa-Chilata and granddaughter Siphokazi Rhoza, I pray to the Almighty Jehovah God that this work will inspire you to aim higher and attain more than what I have been able to reach.

APPROVAL PAGE

The University of Zambia approves this dissertation of Rhoza Chiwambo Shonga in partial fulfillment of the requirements for the award of Master of Public Health.

Definitions of Terms.....	xiii

CHAPTER ONE

1. INTRODUCTION.....	1
1.1 Background Information.....	1
HIV/AIDS epidemic in Sub –Saharan Africa and Zambia.....	1
Antiretroviral therapy (ART).....	2
1.2 Statement of the Problem.....	4
1.3 Research Questions.....	6
1.4 Objectives of the Study.....	6
1.4.1 General Objectives of Study.....	6

1.4.2 Specific Objectives.....	6
1.5 Justification of the Study.....	6

CHAPTER TWO

2. LITERATURE REVIEW.....	8
2.1 Literature Search Strategy.....	8
2.2 Economic Theory.....	8
2.2.1 Principles of Clinical Economies.....	8
2.2.2 Cost –effectiveness Analysis.....	9
2.2.3 Cost-effectiveness Analysis of HAART.....	9
2.3 The Multisectoral Impact of the HIV/AIDS Epidemic.....	11
2.3.1 Impact on Population Structure and Demography.....	11
2.3.2 Impact on Individuals, Households and Community.....	12
2.3.3 Impact on Firms and the Private Sector.....	13
2.3.4 Impact on Governments and the Public Sector.....	14
2.3.5. Impact on the Health Sector.....	14
2.3.6 Impact on Education.....	15
2.3.7 Impact on Agriculture and Food Security	16
2.3.8 Impact on the Macro Economy.....	17
2.4 Antiretroviral Therapy Program.....	17
2.5 Antiretroviral Therapy Scale-up and HIV/AIDS Care.....	18
2.6 Financing and Priority setting for HIV/AIDS.....	19

2.7 Costs and Affordability of HAART.....20

CHAPTER THREE

3. **RESEARCH METHODOLOGY**.....23

3.1 Perspective Analysis.....23

3.2 Economic Evaluation.....23

3.2.1 Cost – Utility Analysis.....23

3.2.2 Cost – Effectiveness Analysis..... 23

3.2.3 Importance of Cost- Effectiveness Analysis.....24

3.2.4. Costs in Economic Evaluation.....24

3.3 Research Design.....25

3.4 Markov Modeling for HIV/AIDS.....25

3.5 Transition Probabilities in Markov Model.....27

3.6 Markov Health States.....27

3.7 Costing Methodology.....29

3.7.1 Inclusion Criteria.....29

3.7.2 Exclusion Criteria.....31

3.8 Study Setting.....31

3.9 Study Population32

3.10 Calculation of Sample Size.....32

3.11 Sampling Technique.....33

3.12 Data Collecting Tools and Technique.....33

3.13 Pilot Study.....	34
3.14 Data Collection/Field Activities.....	34
3.15 Data Processing and Analysis.....	34
3.16 Ethical Considerations.....	34

CHAPTER FOUR

4. RESULTS	35
4.1 Section A: Transition probabilities of ART and No-ART Cohort.....	35
4.2 Section B: EQ – 5D Health Status Rating.....	36
4.3 Section C: Cost-effectiveness Analyses (CEA) results.....	36
4.4 Section D: Life-time Costs and Life Years gained.....	37
4.5 Section F: Qualitative Findings from Key Informants.....	37
4.5.1 Matrix: Key Informants’ Views.....	37

CHAPTER FIVE

5. DISCUSSION OF RESULTS	41
5.1 Challenges and Constraints to the Study.....	41
5.2 Transition Probabilities of the Cohort.....	41
5.3 Rating of Quality of Life using EQ – 5D.....	42
5.4 Cost-effectiveness Analyses Results.....	43
5.5 Life-time Costs of ART versus No-ART.....	44
5.6 Qualitative Findings from Key Informants.....	44

5.7 Strengths and Limitations of Study.....	45
5.8 Sensitivity and Generalizability of the Study.....	46
5.9 Exchange Rate	46
5.10 Suggestions For Further Research.....	46

CHAPTER SIX

ACRONYMS

ART – Antiretroviral Therapy

ARVs – Antiretroviral drugs

CD4 – Cell Differential

CEA – Cost-effectiveness Analysis

CER – Cost-effectiveness Ratio

CUA – Cost-utility Analysis

CBoH – Central Board of Health

FAO – Food Agriculture Organization

HAART – Highly Active Antiretroviral Therapy

HIV/AIDS – Human Immunodeficiency Virus/Acquired Immunodeficiency Syndrome

HRQoL – Health Related Quality of Life

ICER – Incremental Cost-effectiveness Ratio

ILO – International Labor Organization

LYs – Life- years

MOH – Ministry of Health

OIs – Opportunistic Infections

PTB – Pulmonary Tuberculosis

PMTC – Prevention of Mother to Child

QALYs – Quality-adjusted Life-years

QOL – Quality of Life

VCT – Voluntary Counseling Centre

WHO – World Health Organization

ZDHS – Zambia Demographic Health

DEFINITION OF TERMS

Pre – ART period: this is the time between enrollments of a patient in the HIV programme to the time of initiation of ART.

Treatment period (ART): this is the time the patient is on ARVs.

Cost-effectiveness analysis (CEA): A technique in which the cost and effects of an intervention and alternative are presented in a ratio of incremental cost to incremental effect.

Cost-effectiveness ratio (CER): The incremental cost of using an intervention to obtain a unit of effectiveness (such as dollars per life-year gained) compared with an alternative such as another treatment or no treatment.

Cost-utility analysis (CUA): A specific type of cost–effectiveness using quality-adjusted life years as the effectiveness endpoint.

Effectiveness: The extent to which an intervention achieve health improvements, which can be measured in terms of various outcomes such as cases of disease prevented, years of life saved, or quality-adjusted life years saved.

Incremental cost: The difference between the costs/effects of the two interventions of interest.

Incremental cost-effectiveness ratio: The incremental cost of intervention divided by the incremental effectiveness.

Provider’s perspective: This means that all direct health care costs incurred by the provider are considered.

Societal perspective: The costing includes costs to the health system and costs to the patient (e.g. patient waiting time and travel costs).

Gross domestic product (GDP): A commonly used measure of economic growth of a country.

Time trade-off: A method for assessing preferences for a given health state, which the respondent is asked how much time he or she would be willing to trade from a given lifespan in the health state, to have the remaining lifespan in perfect health.

Utility: The preference of an individual for a particular health state or treatment outcome measured using the standard gamble technique, which incorporates risk in the assessment.

Quality-adjusted life years (QALYS): is a measure of disease burden, including both the quality and the quantity of life lived.

Opportunity cost: the value of the foregone opportunity uses in a different way those resources that are used or lost due to illness.

Quality of Life (QOL): measures severity of illness or disability which defines death as zero and perfect health as one.

Extrapolate: To estimate something or form opinion about something using the facts that you have now and that are valid for one situation and supposing that they will be valid for the new one.

Health state: The condition of an individual's health, including any disease, disability, and functional status.

Transition probabilities: In a Markov model, these are specific relevant movements between Markov health states.

Case fatality rate (CFR): Number of deaths from a disease in a given period divided by number of diagnosis of that disease in the same period.
